

Rho - Gallarate line, 3rd track

The upgrade of the Gallarate-Rho line contemplates building a third track flanking the two existing ones for an overall length of approx. 25 km. The project includes building a new passenger interchange stop at the level of Castellanza, between the networks RFI/FNM, as well as adjusting technological installations, engineering works and building underpasses, where not present. The aim is to reinforce the network for the district service and the long haul passenger service, upgrading a route preparatory to the building of the Malpensa Airport access systems.
