

Rome Tiburtina infrastructure building

The origins of this project lie within the Rome Tiburtina district infrastructure-building programme. The first phase of the works, now completed, concerned the jubilee programme with the regeneration of the tracks and the building and launching of the floor of the future station-bridge.

Completion of the infrastructure-building will concern: building the new High Speed Station which, following the design drawn up as a result of an International Competition, has already been awarded; all the work in the urban fabric which, albeit of municipal competence, is inseparable at the construction phase, will be carried out by RFI.
